Project Title COMPANY BANKRUPTCY PREDICTION

By-Bhushan Patil

Problem Statement

Prediction of bankruptcy is a phenomenon of increasing interest to firms who stand to loose money because on unpaid debts. Since computers can store huge dataset pertaining to bankruptcy making accurate predictions from them before hand is becoming important.

The data were collected from the Taiwan Economic Journal for the years 1999 to 2009. Company bankruptcy was defined based on the business regulations of the Taiwan Stock Exchange.

Data Summary

There are 3 categorical variables and 93 numerical variables

Categorical variables

Bankrupt?

1: Yes, 0: No

Liability-Assets Flag

1 : if Total Liability exceeds Total Assets, 0 : otherwise

Net Income Flag

1: if Net Income is Negative for the last two years, 0: otherwise

Dataset

- There are 6819 entries and 96 columns
- 93 out of 96 are numeric (float)
- 3 out of 96 are categorical

Bankrupt? Liability-Assets Flag

Net Income Flag

```
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 6819 entries, 0 to 6818
Data columns (total 96 columns):
                                                               Non-Null Count Dtype
     Column
     bankrupt?
                                                                6819 non-null
                                                                                int64
     roa(c) before interest and depreciation before interest
                                                               6819 non-null
                                                                                float64
     roa(a) before interest and % after tax
                                                                6819 non-null
                                                                                float64
     roa(b) before interest and depreciation after tax
                                                                6819 non-null
                                                                                float64
     operating gross margin
                                                                                float64
                                                                6819 non-null
     realized sales gross margin
                                                                                float64
                                                                6819 non-null

```

Data Description

Y = Output feature Y - Bankrupt?

X = Input features X - 95 features

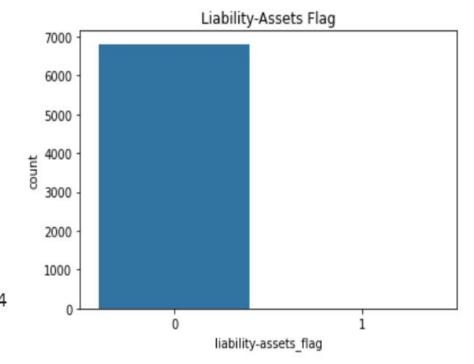

Value Count of Liability-Assets Flag

0: otherwise

1 : if Total Liability exceeds Total Assets

0 6811 1 8

Name: liability-assets_flag, dtype: int64

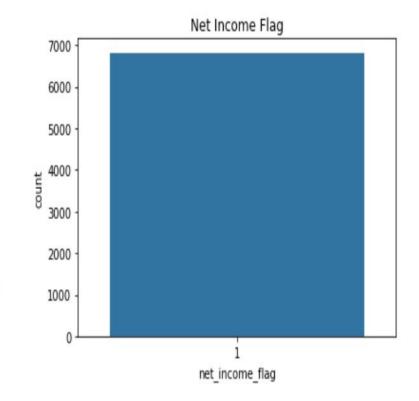

Value Count of Net Income Flag

1 : if Net Income is Negative for the last two years

0 : otherwise

1 6819
Name: net_income_flag, dtype: int64

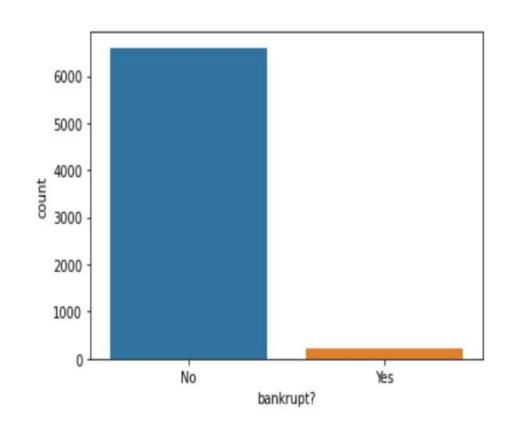

Value Count of Target variable

0 : No

1 : Yes

0 6599 1 220

Name: bankrupt?, dtype: int64

The Metric Trap

```
Distribution of classes of dependent variable in train:
bankrupt?
0 5274
1 181
dtype: int64

Distribution of classes of dependent variable in test:
bankrupt?
0 1325
1 39
dtype: int64
```

By using XGB Classifier we can get 97% accuracy.

We are getting very high accuracy because it is predicting mostly the majority class that is 0 (Non-fraudulent).

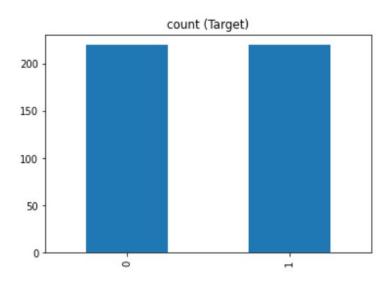

Resampling Techniques

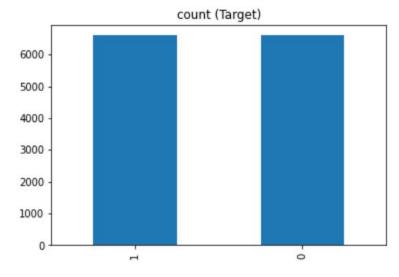

- 1. Random Under-Sampling
- 2. Random Over-Sampling
- 3. Random under-sampling with imblearn
- 4. Random over-sampling with imblearn
- 5. Under-sampling: Tomek links
- 6. Synthetic Minority Oversampling Technique (SMOTE)
- 7. Near Miss
- 8. Penalize Algorithms (Cost-Sensitive Training): Support vector classifier

Random Under-Sampling and Over-Sampling

Random Under-Sampling

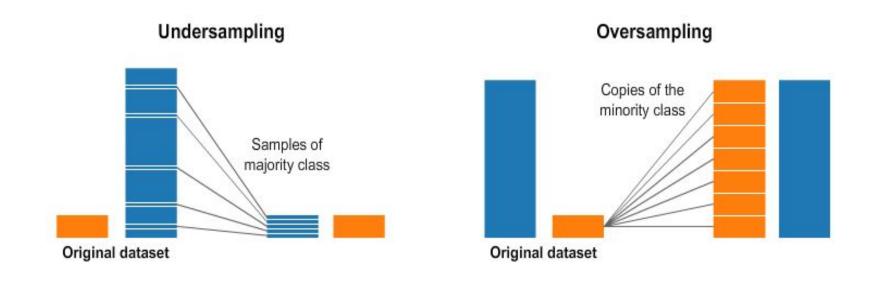

Random Over-Sampling

Imbalance problem

Apply both Under-Sampling and Over-Sampling techniques.

Recursive feature elimination (RFE) is a feature selection process that suits a model and eliminates the weakest feature (or features) before the required number of features is achieved. Features are rated by the model's coef or feature importances attributes, and RFE aims to remove dependencies and collinearity by recursively deleting a small number of features per loop.

Feature Selection

Test score: 0.968 number of features: 15

```
RangeIndex: 6819 entries, 0 to 6818

Handling Outliers

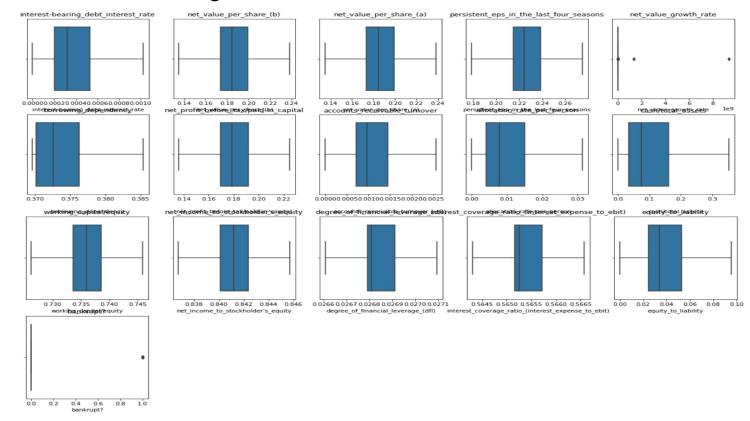

Using Outlier Insensitive Algorithms

Some algorithms that are not sensitive to outliers are Naive Bayes Classifier, Support Vector Machine, Decision Tree, Ensemble Techniques, and K-Nearest Neighbours. We can use these algorithms to get rid of outliers.

Caps outliers to closest existing value within threshold (IQR)

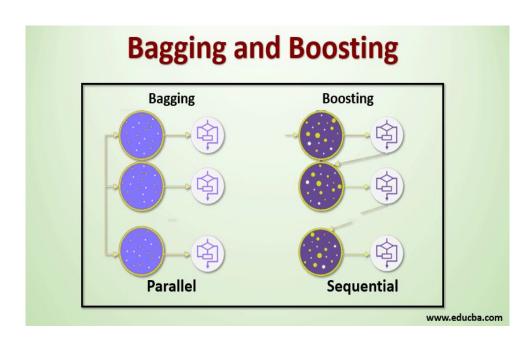

Verification of Deleting Outliers

Model Used

- Random Forest Classifier
- Gradient Boosting Classifier
- XGB Classifier
- Cat Boost Classifier
- LGBM Classifier
- SVM Classifier
- Decision Tree Classifier
- Logistic Regression

CONCLUSION

- 1. Random forest classifier, XGB Classifier, LGBM Classifier give best results.
- 2. Random forests, Cat boost classifier, LGBM classifier, XGBoost give best roc-auc value above 95%.
- 3. Oversampling method perform better than undersampling method.
- 4. Model testing report on overall data give best results because we use non sensitive algorithms.
- 5. Random forest classifier model used after feature selection by using Recursive feature elimination (RFE) process give best results.
